

CHATBOT

TEAM PHI

10 Th November

How It Works In Background :

1. login section :

Chatbot at first will ask for name. If he or she turns out to be new user then they have to do sign up by creating password and filling some form. After successfully creating account the user.txt file will be created which will store all data of user in further period.

And if he/she turns out to be existing user. Then they have to put their password for sign in purpose. And if password doesn't match it will not let you enter for further chatbot feature.

2. lists of basic questions :

at the initial point only there will be some lists which will contain words like hi, hello, with some basic question like how are you and so on and greetings like good morning and similar words. And if user enters question or input among this response will be chosen from response list randomly.

3. key word base search :

when user will give input on the basis of predefined key word if chatbot finds keyword in user input. It will give appropriate answer according to situation. Like giving answer manually on bot or opening browser with appropriate site.

4. making it more personalize :

the more you will use it the more it will become personalized. As it saves the data you wanted to save.
